Executive decision brief: an eight-week pilot for emerging neuropsychiatry opportunity intelligence

Prepared for	Will Hargreaves / Real Chemistry
Prepared by	Rayven-Nikkita Collins
Version	28 July 2026
Information boundary	Public and permitted-source design; no client-confidential or restricted data.

The public evidence establishes what Real Chemistry already demonstrates. It does not resolve what only Real Chemistry can know. Pilot 1 is designed around that boundary.

The decision on the table

Approve the scope and minimal inputs for Pilot 1. No production integration, internal data, CRM connection, or ANATOMI build is required.

DECISION

Proceed with a 50–75-company public-source research universe and a 12–15-account human-reviewed priority portfolio.

What Will is not being asked to approve

- A production AI product or autonomous target-selection system.
- Use of client-confidential, patient-level, licensed, or restricted data.
- ANATOMI, CRM, or internal engineering integration.
- A claim that Real Chemistry lacks AI, analytics, intelligence, or monitoring capabilities.

The precise white space

Real Chemistry publicly demonstrates nearly all technical and analytical ingredients. What is not publicly demonstrated is a unified, owned growth workflow that organizes early external company evidence around prospective-account decisions.

Will’s diligence questions — direct answers

AI model	A governed model-task portfolio, not one undifferentiated model. AI assists bounded extraction, comparison, classification, contradiction detection, and draft synthesis. Humans retain inclusion, interpretation, scoring, prioritization, and distribution authority.
Assumptions	All consequential assumptions are registered and labeled evidence-supported, methodological, provisional, or internal-calibration-required. Scope, signal definitions, thresholds, recency, weights, missing data, and false-positive risk remain visible.
Sources + permissions	Pilot 1 defaults to official, first-party, public-domain, and properly permitted sources. Every record carries source, access method, rights class, storage, model-use, output, audience, retention, and restriction fields.
Compliance	Company-level research requires no PHI. Restricted sources are excluded by default. Evidence tiers, human gates, audit records, and escalation pathways preserve healthcare, privacy, security, source-rights, and AI-governance boundaries.
Reliability + limits	Primary sources and validated records are the foundation. The method labels facts, corroborated findings, inferences, and hypotheses separately. Public evidence cannot establish clients, conflicts, relationships, capacity, economics, or pursuit history.

What Pilot 1 produces

A complete initial engagement—not a sample sprint.

8 weeks	Company universe; 12-15 priority dossiers; external opportunity score; rejected/deferred list; recommendation.	No production integration.
50-75 companies	Source-permission register; assumption register; evidence ledger; model-task register.	No internal or client-confidential data.
Human-reviewed portfolio	Reasons to advance, monitor, defer, exclude, redirect, or mark insufficient evidence.	No automated pursuit decision.

The protected distinction

EXTERNAL	Pilot 1 asks which companies appear externally attractive for Real Chemistry review.
INTERNAL	A later calibrated phase asks which externally attractive companies are plausible internal pursuits.

How the method moves from signal to decision

Discover / Pilot 1	Universe, ontology, evidence architecture, external score, dossiers, registers.	Scope, geography, stage, intended reader, public service priorities, success standard.	Which companies warrant internal review?
Qualify / conditional	Calibrated rules, internal viability layer, reviewer workflow.	Clients, pursuits, conflicts, ownership, thresholds, economics, judgment.	Which external opportunities are plausible pursuits?
Institutionalize / conditional	Monitoring, queues, outcome capture, recalibration design.	Approved systems, CRM, data feeds, ANATOMI/workspace decisions.	Should this become an owned recurring capability?

Eight-week cadence

Scope	Taxonomy	Universe	Verify	Score	Dossiers	Portfolio	Handoff

Safeguards and evaluation

Human authority remains explicit

- Source approval → record validation → analytical approval → account review → distribution approval.
- The portfolio may contain hypotheses, but it never relabels model synthesis as verified fact.
- External opportunity and internal pursuit viability remain separate.

Evaluation without fake precision

Research quality	Citation accuracy, source coverage, stale-record rate, contradiction flags.
Decision quality	Reviewer usefulness, false positives, reasons to advance or defer.
Commercial relevance	Accounts worth internal review, service-fit clarity, timing insight.
Governance	Permission compliance, restricted-source exclusion, audit completeness.
Learning	Which signals corresponded with interest, deferral, pursuit, or rejection.

What Will needs to confirm

- Therapeutic scope, geography, company stage, and included modalities.
- The intended internal reader for the final portfolio.
- Which public-facing service priorities should inform preliminary service mapping.
- Whether the full public-source Pilot 1 may proceed without internal data.
- What would make the portfolio useful enough to consider later calibration.

RECOMMENDATION

Run Discover first. Reserve ANATOMI, CRM, licensed-source enrichment, and production integration for a later decision after usefulness is demonstrated.
