

REAL CHEMISTRY / INTERNAL DISCUSSION

Inflection Radar

Internal research report: method, governance, capability fit, validation, and Pilot 1 decision architecture

Prepared for	Will Hargreaves / Real Chemistry
Prepared by	Rayven-Nikkita Collins
Version	28 July 2026
Information boundary	Public and permitted-source design; no client-confidential or restricted data.

The public evidence establishes what Real Chemistry already demonstrates. It does not resolve what only Real Chemistry can know. Pilot 1 is designed around that boundary.

Executive summary

Inflection Radar is a growth-decision method, not another analytics platform. It identifies emerging companies before ordinary pursuit activity begins, explains the public evidence suggesting possible need, maps that evidence to Real Chemistry capabilities, and preserves source permissions, uncertainty, and human authority.

CONCLUSION The public record supports saying Real Chemistry has the ingredients. It does not establish whether those ingredients are assembled into this specific upstream growth workflow.

Questions presented

- Is the method technically feasible without internal integration?
- What model architecture and assumptions govern it?
- Which sources may be used, under what permissions and controls?
- How reliable are the outputs, and what can public evidence not establish?
- Does the method complement rather than duplicate Real Chemistry capabilities?

Recommended decision

Authorize Pilot 1 as an eight-week, public-source, 50–75-company research engagement producing a 12–15-account human-reviewed portfolio and the records needed to defend it.

1. Decision and scope

Pilot 1 is the full initial engagement. It is intentionally independent of production systems.

Decision requested

Approve scope, reader, public service priorities, and the standard by which the portfolio will be useful.

Included

Universe construction; signal ontology; source hierarchy; evidence architecture; scoring; sensitivity review; dossiers; rejected/deferred list; recommendation.

Excluded

Production integration; internal/client data; PHI; unapproved scraping; autonomous pursuit decisions; claims about internal capability that public evidence cannot resolve.

2. Method: from universe to portfolio

The method starts broad enough to observe patterns, then narrows through explicit evidence and human review.

Universe

50–75 emerging neuropsychiatry and adjacent CNS/brain-health companies within the agreed geography, stage, and modality boundaries.

Priority portfolio

12–15 companies selected for internal review—not automatically for pursuit.

Disposition set

Advance; monitor; defer; exclude; redirect to another practice; insufficient evidence.

3. Signal ontology

Companies are prioritized when multiple source-linked signals suggest a commercially meaningful inflection—not because they are merely interesting.

Clinical and regulatory movement

Trial initiation, readout, designation, filing, approval, safety development, endpoint change.

Capital and corporate movement

Financing, licensing, M&A, board changes, partnerships, restructuring.

Commercialization readiness

Hiring, launch preparation, access, medical affairs, communications, stakeholder expansion.

Narrative and reputation complexity

Public controversy, expectation gaps, scientific uncertainty, stakeholder disagreement.

Leadership and organizational change

New commercial, medical, legal, communications, or market-access leadership.

Ecosystem visibility

Conference presence, publication activity, policy engagement, KOL or advocacy participation.

4. Evidence architecture

Source quality remains visible throughout the reasoning chain.

Tier 1 — verified fact

Government records and first-party corporate disclosures.

Tier 2 — corroborated finding

Multiple reliable sources or authoritative secondary reporting.

Tier 3 — analytical inference

Interpretation grounded in verified records and a documented reasoning chain.

Tier 4 — hypothesis or early signal

A provisional service-need or timing hypothesis requiring human scrutiny.

5. Scoring and human decision

A score prioritizes review. It is not a verdict.

External Opportunity Score

Strategic relevance; timing; evidence strength; service-need clarity; commercialization complexity; narrative/reputation complexity; Real Chemistry differentiation; risk-adjusted review priority.

Internal Pursuit Viability

Clients; conflicts; active pursuit; relationship; prior pursuit; economics; capacity; ownership; geography; agency position; strategic priority.

Human Portfolio Decision

A reviewer combines evidence, score, internal context, uncertainty, and judgment to choose a disposition.

6. AI model-task portfolio

Provider-flexible does not mean model-indifferent. Selection is task-by-task and governed.

AI-assisted

Extraction, entity-resolution support, document comparison, classification, contradiction detection, and draft synthesis.

Deterministic

Source registry, record IDs, required fields, weights, date rules, citation links, versioning, and schema validation.

Human-only

Company inclusion, signal meaning, score override, service relevance, compliance escalation, final portfolio, and distribution.

7. Assumption register

Every consequential assumption has an owner, basis, status, and calibration path.

Therapeutic scope	Emerging neuropsychiatry and adjacent CNS/brain health	Internal calibration required
Geography	Define before universe construction	Internal calibration required
Company stage	Pre-commercial through early commercialization	Provisional

Inflection point	Observable change likely to alter commercialization or stakeholder needs	Methodological
Evidence threshold	No priority placement on a single weak signal	Evidence-supported
Recency	Signal-specific windows; stale records remain visible	Methodological
Missing data	Never treated as a negative fact	Methodological
Weights	Transparent; tested through sensitivity analysis	Provisional
Public evidence	Cannot establish clients, conflicts, relationships, economics, capacity, or ownership	Evidence-supported

8. Source-rights and permission architecture

The control model follows data through its lifecycle rather than assigning one simplistic label.

Lifecycle layers

Decision/use case; acquisition; rights; engineering/security; retrieval/provenance; analysis/orchestration; validation/compliance; output/action/monitoring.

Source-rights classes

Government/public domain; public copyrighted; licensed commercial; Real Chemistry proprietary; client-confidential; personal/sensitive/regulated; derived intelligence.

Data states

Raw; normalized; indexed; derived; distributed.

Control planes

Purpose/authority; rights/data protection; security; model/agent governance; healthcare/communications; evidence integrity; human accountability; monitoring/audit/incident response.

Human gates

Source approval; record validation; analytical approval; account review; distribution approval.

Deployment zones

Open research; controlled enterprise; client-restricted; regulated health/safety.

Incident pathways

Security/privacy; AI/evidence integrity; healthcare safety.

9. Pilot 1 source perimeter

Core	Permitted, source-linked default	SEC; FDA; ClinicalTrials.gov; USPTO; registries; official company sites/releases; official conference agendas; PubMed/Crossref metadata; permitted open access.
Conditional	Use only with entitlement or specific approval	Licensed news; PitchBook; commercial biotech databases; social listening; publisher full text; conference slides/recordings; LinkedIn; job boards.
Excluded initially	No ingestion or automation	Scraped LinkedIn/job boards; attendee lists; PHI; inferred health information; purchased contacts; client-confidential material; access-controlled sources without permission; full corpora without rights.

Derived intelligence inherits restrictions

A transformed field does not become unrestricted merely because a model produced it. Derived records retain the rights, audience, retention, and distribution constraints of their inputs.

10. Healthcare, privacy, security, and communications safeguards

Company-level scope

Pilot 1 researches companies, assets, milestones, and organizational signals. PHI is not required.

Safety firewall

Potential adverse-event or product-complaint content encountered later is isolated and escalated through the appropriate Real Chemistry process.

Promotional boundary

The deliverable is internal account intelligence, not external promotion, medical advice, or product claims.

Information security

Approved storage, access, retention, provider, and transfer terms are chosen before restricted sources enter any later phase.

Evidence integrity

Every claim retains source, extraction date, evidence tier, reviewer, disposition, and contradiction status.

Distribution authority

No output moves to a new audience without an explicit approval gate.

11. Capability fit and non-duplication

The proposal is designed around what Real Chemistry publicly demonstrates—not around a claim of absence.

Confirmed have	ANATOMI; RCIS Workspace; HealthGEO; ReputAI; extensive Analytics & Insights products; AI assistants; agentic and evidence-aware workflows; growth/revenue leadership.	Do not pitch generic AI, analytics, monitoring, audience intelligence, or commercialization capability.
Confirmed boundary	Public sources describe capabilities and examples but not every access, ownership, workflow, or governance detail.	State only what the source establishes.
Not publicly evidenced	Unified emerging-company prospect universe; growth-facing target score; cross-practice routing; conflict-aware qualification; win/loss feedback loop.	Candidate workflow white space—not proof of nonexistence.
Internally unknown	Current growth process, ANATOMI access, CRM, licensed sources, conflicts, ownership, economics, historical pursuit data.	Questions for Will and relevant internal reviewers.

12. Real Chemistry capability map

ANATOMI / RCIS Workspace	Potential later workflow environment; internal access and custom workflow support unknown.
Analytics & Insights	Signals, validation, listening, ecosystem, audience, journey, prediction, and measurement expertise.
HealthGEO / ReputAI	Search-perception, source, reputation, and predictive message intelligence.
Integrated Communications / Medical Communications	Narrative, evidence, stakeholder, publication, and scientific-context interpretation.
Market Access / Media / Omnichannel	Commercialization need, access environment, audience and channel implications.
RC Resolve	High-consequence inflection interpretation and stakeholder response.
Growth / Revenue / Global Client Leads	Portfolio decision, account ownership, routing, economics, and pursuit viability.
Legal / Privacy / Security	Rights, data protection, model terms, restricted sources, access, retention, and escalation.

13. Discover → Qualify → Institutionalize

Discover — Pilot 1	Which companies appear externally attractive for review?	Public/permitted evidence; external score; 12–15 dossiers; governance records.

Qualify — conditional	Which external opportunities are plausible internal pursuits?	Client/pursuit/conflict screening; service ownership; thresholds; economics; reviewer judgment.
Institutionalize — conditional	Should the method become a persistent owned capability?	Recurring monitoring; queues; CRM; approved data feeds; ANATOMI/workspace; outcomes; recalibration.

14. Eight-week workplan

1	Scope, decision, source perimeter, governance, schema
2	Taxonomy, assumptions, evidence rules, entity model, dossier template
3	Candidate discovery, universe build, inclusion/exclusion
4	Primary-source verification, normalization, entity resolution
5	Scoring, sensitivity analysis, false-positive and missing-data review
6	Priority dossier production
7	12-15-account portfolio, rejected/deferred list, unresolved questions
8	Evaluation, handoff, recommendation, future-stage decision

Weekly operating rhythm

A short memo records what changed, which records were added or blocked, which sources were used, and which assumptions or decisions require review.

15. Priority dossier specification

Account snapshot	Company, modality, stage, geography, funding, lead assets, leadership.
Evidence summary	Most consequential verified facts, corroborated findings, inferences, and hypotheses.
Clinical and regulatory position	Trials, milestones, designations, filings, safety, endpoints, timing.
Corporate movement	Financing, partnerships, licensing, M&A; board and leadership change.
Commercialization readiness	Hiring, launch preparation, medical affairs, access, communications, stakeholder expansion.
Narrative and reputation	Expectations, controversy, scientific uncertainty, stakeholder disagreement.
Real Chemistry relevance	Potential capability fit and the evidence behind it.
Permission record	Source, rights class, acquisition, storage, model use, audience, retention.
Human review	Contradictions, missing evidence, score override, compliance questions.
Suggested internal next step	Advance, monitor, defer, exclude, redirect, or insufficient evidence.

Reasoning chain

TRACEABILITY	Source → fact → signal → inflection hypothesis → Real Chemistry relevance → internal question.
--------------	--

16. Evaluation and validation

Citation audit	Confirm each material fact resolves to the precise source and extraction date.
Contradiction review	Surface inconsistent records rather than silently reconciling them.
Sensitivity analysis	Show whether reasonable weight changes alter priority placement.
False-positive review	Examine attractive-looking companies that fail the evidence or service-need test.
Missing-data review	Ensure absence is not scored as a negative fact.
Baseline comparison	Compare against simple financing, clinical-stage, and any safely available internal target list.
Reviewer study	Assess usefulness, clarity, defensibility, and reasons to advance/defer.
Governance audit	Verify permission, restricted-source exclusion, approvals, and audit completeness.

17. Business case, IP, maintenance, and offboarding

Business case

The pilot should be valued by improved account-review quality, earlier visibility, clearer service-need hypotheses, reduced research duplication, and reusable evidence—not by pretending every priority company becomes revenue.

Build versus buy

Commercial tools may supply raw ingredients. The distinctive layer is the source-governed translation from company movement to Real Chemistry-specific growth questions and learning.

Intellectual property

Before calibration, define ownership of the ontology, schemas, code, prompts, dossiers, derived registers, and Real Chemistry-specific modifications. Do not leave the boundary implicit.

Maintenance

A persistent system needs owners for sources, ontology, thresholds, access, model approvals, reviewer queues, incident handling, and outcome capture.

Offboarding

Exports should remain usable without a specific model provider. Credentials, restricted data, retention obligations, access, and deletion must be handled explicitly.

18. Internal discovery questions

Current process

- Who identifies entirely new prospective companies today?
- Are target lists centralized or practice-specific?
- Is pre-commercial biotech monitored before RFPs?
- Where are early signals recorded?

Existing capability

- Does Analytics & Insights support internal growth?
- Is ANATOMI used for prospect discovery or qualification?
- Is there already a watchlist, dashboard, or target-account score?

Calibration

- How are clients, pursuits, and conflicts screened?
- Who owns a prospective account before a formal opportunity exists?
- What economics, capacity, and thresholds matter?

Technology

- Which AI environment is approved?
- Can a structured company dataset and ontology be accepted?
- Which licensed sources are available?
- What is the growth CRM?

Measurement

- What would make the portfolio useful or duplicative?
- Are historical examples available?
- Could outcomes be connected to originating signals?

Appendix A. Minimum data structure

company	Canonical identity and aliases
source	URL, title, publisher, access date, rights class
fact	Source-grounded factual record
signal	Ontology family and normalized event
evidence tier	Verified, corroborated, inference, or hypothesis
inflection hypothesis	Why the signal may matter now
service relevance	Possible Real Chemistry capability fit
score	Dimension values, rationale, weight version
review	Reviewer, disposition, override, unresolved question
governance	Restrictions, audience, retention, approvals

Appendix B. Evidence-of-capability register

ANATOMI	Confirmed have	Publicly described AI ecosystem combining data, LLMs, orchestration, analytics, and agentic tools.	Is it used for internal growth? Is custom dataset/ontology support available?
Analytics & Insights	Confirmed have	Broad AI/ML and named intelligence, listening, segmentation, prediction, and measurement products.	Which products support prospective-account decisions?
HealthGEO	Confirmed have	AI-search perception and source intelligence.	Does it feed growth or account qualification?
ReputAI	Confirmed have	Reputation measurement and predictive message testing.	Can outputs inform early account hypotheses?
Growth workflow	Not publicly evidenced	No public evidence located for the unified workflow described in this report.	Does an equivalent internal process already exist?
CRM/conflicts/outcomes	Internally unknown	Public evidence cannot resolve systems, rules, ownership, or history.	What can be safely used during calibration?

Verification note

The capability assessment relies on public Real Chemistry materials and official public sources. Dynamic webpages, product names, access conditions, and technical descriptions must be rechecked immediately before external circulation. Public-source statements are evidence classifications, not representations about non-public Real Chemistry systems.
