

From signal to growth decision

A Pilot 1 architecture for emerging neuropsychiatry opportunity intelligence

Prepared for Will Hargreaves / Real Chemistry

Prepared by Rayven-Nikkita Collins

PILOT 1 STARTS HERE

Direct answer to Will's diligence points

This report is organized around the questions Will raised: the AI model, the assumptions, the source access and permissions, the compliance posture, and whether the resulting insights can be trusted enough to use.

1

AI model

Not one model. A model-task portfolio: extraction, comparison, classification, contradiction detection, draft synthesis. Human reviewers retain authority over inclusion, interpretation, scoring and distribution.

3

Source access

Pilot 1 uses public, official, first-party and otherwise permitted sources. Public availability is not treated as blanket permission for scraping, retention, AI processing or redistribution.

5

Insight validity

The output is a decision aid, not an automated pursuit decision. Every finding is classified as verified fact, corroborated finding, analytical inference or unresolved question.

2

Assumptions

The pilot keeps assumptions visible: therapeutic scope, company stage, geography, signal meaning, scoring weights, recency windows and Real Chemistry capability mapping.

4

Compliance

The pilot operates at company and market level. Patient-level data and PHI are not needed for Pilot 1. Any safety or product-complaint signal would be isolated and escalated through Real Chemistry's designated process if the work later becomes internal.

The first commitment is Pilot 1: a full 50-75 company universe, not a sample sprint.

The decision on the table

Will is not being asked to approve an ANATOMI integration or a production AI product. The immediate decision is whether to proceed with Pilot 1: an independently built opportunity-intelligence pilot designed to be internally useful and later calibratable.

50-75

ANATOMI ACCESS NEEDED NOW

What Real Chemistry gets

A ranked, source-linked portfolio showing which emerging neuropsychiatry companies appear to be approaching commercially meaningful inflection points and why those moments may matter to Real Chemistry.

What Real Chemistry decides later

Whether the method should be calibrated with internal context and whether it is worth institutionalizing through ANATOMI, Analytics & Insights, CRM or another approved environment.

What Inflection Radar is

Inflection Radar is a growth-decision method, not another analytics platform.

It converts public evidence about emerging companies into a reviewable account portfolio: what changed, why the change may matter, which Real Chemistry capabilities could be relevant, what is still uncertain and what an internal reviewer would need to validate next.

Design thesis

Real Chemistry publicly demonstrates substantial AI, analytics, healthcare-intelligence and commercialization capabilities. Inflection Radar is therefore designed to complement those assets by organizing one specific upstream decision: which emerging companies deserve attention before ordinary pursuit activity makes them obvious.

Why emerging neuropsychiatry

Neuropsychiatry is a high-noise, high-consequence opportunity space.

- Clinical signals are heterogeneous: drugs, devices, diagnostics, digital therapeutics, biomarkers, neuromodulation and controlled-substance approaches may all enter the same market conversation.
- Commercial readiness often appears indirectly through trials, hiring, publications, congress presence, financing, leadership and narrative stress before a company issues an RFP.
- The category requires science translation, patient and HCP trust, policy awareness, market-access readiness and careful communications.
- That combination fits RN's background and maps to Real Chemistry's public capabilities without pretending that Real Chemistry lacks data or AI.

Earlier than
obvious

Pilot 1 universe methodology

The pilot starts wide enough to see pattern, then narrows enough to support action.

1

1. Candidate discovery

100–150 initial companies sourced from official records, company sites, clinical registries, conference programs, financing news and open intelligence.

2

2. Eligibility screen

Therapeutic relevance, visible movement, source support and plausible Real Chemistry relevance.

3

3. 50–75 universe

Structured company records with entity resolution, source ledger and signal coding.

4

4. 12–15 portfolio

Highest-value, evidence-linked accounts for human review and internal calibration.

SELECTION RULES

Inclusion requires relevance, movement, evidence and plausible service connection. Exclusion occurs when evidence is too thin, entity status is unresolved, the company falls outside scope, or the opportunity would require restricted data not needed for Pilot 1.

Signal ontology: the six families of movement

Inflection Radar does not rank companies because they are interesting. It ranks companies when multiple source-linked signals suggest a commercially meaningful moment.

S1

Clinical + scientific

trial starts/completions, results, publications, congress activity, indication expansion

S2

Regulatory

FDA actions, designations, safety signals, label or policy milestones

S3

Corporate

financing, partnerships, M&A, leadership, restructuring, board movement

S4

Commercial readiness

medical affairs, market access, launch, patient engagement, comms hiring

S5

Narrative + reputation

media attention, stigma, policy sensitivity, misinformation, investor story

S6

Real Chemistry fit

where a public signal may map to medical, communications, access, media, analytics or advisory

Evidence hierarchy

The system keeps source quality visible so the reader can see exactly how hard each claim can be pressed.

Tier 1

Official / primary

SEC, FDA, ClinicalTrials.gov, USPTO, company filings and official releases

Tier 2

First-party public

company website, investor deck, careers page, official conference listing

Tier 3

Independent corroboration

reputable media, scholarly metadata, licensed intelligence if approved

Tier 4

Analytical inference

Rule

The portfolio can include hypotheses, but it must label them as hypotheses. Pilot 1 never converts model synthesis into a verified fact.

External opportunity score

A score is not a verdict. It is a transparent way to prioritize human review.

Timing / 15

Evidence / 15

Service need / 20

Complexity / 15

Strategic fit / 15

Visibility/access / 10

Risk-adjusted viability / 10

The protected distinction

Pilot 1 produces an external opportunity score using visible evidence. A later Real Chemistry calibration layer would separately assess internal pursuit viability: clients, conflicts, prior pursuits, practice priorities, ownership, capacity and economics.

Internal pursuit viability is a separate layer

The strongest design choice is refusing to pretend that public evidence can answer internal commercial questions.

PILOT 1

External opportunity

What changed in the world: clinical, regulatory, corporate, hiring, narrative and stakeholder signals. This can be built independently.

PHASE 2

Internal viability

What Real Chemistry alone can know: active client, conflict, prior pursuit, relationship, owner, service capacity, strategic priority and account economics.

Human portfolio decision

The combined result is not an automated target list. It is a reviewed account portfolio with explicit reasons to advance, defer, monitor or exclude.

AI model-task portfolio

The model does bounded work. It does not own the decision.

1

AI-assisted

extraction, deduplication support, entity variants, contradiction detection, classification, draft synthesis

2

Deterministic

source registry, field validation, weights, record IDs, date rules, citation links, versioning

3

Human-only

company inclusion, signal meaning, score override, service fit, compliance escalation, final portfolio

The architecture can be implemented with RN's independent tools for Pilot 1. If Real Chemistry later calibrates the work internally, the model environment should be whatever Real Chemistry approves.

Permission-aware source architecture

Every source is governed as a path, not a pile of data.

Pilot 1 default

Use official, first-party and permitted public sources; store structured facts, evidence excerpts and citations; avoid unapproved scraping and restricted licensed-source ingestion.

Later internal default

Real Chemistry-approved workspace, model endpoint, source entitlements, review process, retention schedule and routing rules.

Healthcare safeguards

The scope is designed to answer Will's compliance concern without overbuilding the first phase.

C1

Company-level research

Pilot 1 is about companies, assets, milestones and public organizational signals.

C2

No PHI needed

Patient-level data and protected health information are not required to identify company inflection points.

C3

Safety firewall

If later internal work encounters possible adverse-event or product-complaint content, it is isolated and escalated through Real Chemistry's process.

C4

Promotional boundary

The pilot produces internal account intelligence, not external promotional claims or medical advice.

C5

Source inheritance

Derived fields carry the restrictions of their inputs.

C6

Audit trail

Claims link back to source, extraction date, evidence tier, reviewer and disposition.

Source permission matrix

Pilot 1 starts with sources that can support a defensible external opportunity map.

Green / source-linked**Official records**

SEC, FDA, ClinicalTrials.gov, USPTO

Amber / targeted extraction**Company sources**

websites, releases, decks, careers

Green-amber**Conference + scholarly**

programs, abstracts, metadata

Amber / rights-dependent**News + media**

reputable reporting, licensed databases if approved

Red-amber for automation**LinkedIn / platforms**

manual discovery only unless authorized

Contract-dependent**Commercial databases**

PitchBook/Citeline/etc. only if Real Chemistry licenses permit

Designed to complement Real Chemistry

The public evidence does not support pitching Real Chemistry a generic AI or analytics product.

Real Chemistry already publicly demonstrates substantial AI, analytics, data, communications, media, medical, market-access and advisory capabilities. The candidate white space is the operating layer that connects early external company signals to growth-specific account decisions.

Confirmed ingredients

ANATOMI, HealthGEO, ReputAI, Analytics & Insights, agentic workflows, AI assistants, evidence-aware medical workflows, revenue/growth leadership.

Not publicly evidenced

A unified emerging-company prospect universe, service-need mapping, internal viability score, cross-practice routing and win/loss learning loop.

Pilot 1 role

Build the external evidence and opportunity map first; let Real Chemistry decide whether and how to calibrate or institutionalize it.

Real Chemistry capability fit map

Pilot 1 should be internally passable because each function can quickly see where it belongs

Discover → Qualify → Institutionalize

Pilot 1 begins the work. The later horizons explain how the work becomes more internally useful if Real Chemistry chooses to continue.

Pilot 1

DISCOVER

50–75 company universe, 12–15 priority accounts, source-linked dossiers, external score.

Calibration

QUALIFY

client status, conflicts, prior pursuit, service taxonomy, internal thresholds, practice review.

System

INSTITUTIONALIZE

recurring monitoring, review queues, CRM connection, ANATOMI/workspace integration, outcome learning.

Only Discover is needed now. Qualify and Institutionalize are deliberately conditional: they require demonstrated usefulness and Real Chemistry decisions.

What Real Chemistry input is needed—and when

Pilot 1 requires minimal input. Later phases require internal context because only Real Chemistry can answer internal viability questions.

Input	Needed when	How it is used
Therapeutic/geographic scope	Pilot 1	defines the company universe
Public service priorities	Pilot 1	improves preliminary service mapping
Client/active-pursuit exclusions	Calibration	prevents false positives
Conflict rules	Calibration	adds restricted-account logic
Internal service taxonomy	Calibration	routes signals to actual teams
CRM + outcome data	Institutionalization	enables feedback and score learning
ANATOMI/workspace architecture	Institutionalization	selects a supported host and integration pattern

Pilot 1 execution plan

Eight weeks, full universe, source-linked output.

Weekly cadence

A short weekly memo: what changed, what was added, which sources were used, which assumptions need review and which records are blocked.

Final handoff

Portfolio deck, company dossiers, source register, assumption register, scoring sheet, rejected-company log and recommendation.

Dossier anatomy

Each priority account should be useful in a two-minute scan and defensible in a full review.

Account snapshot

Evidence summary

Clinical/regulatory position

Corporate movement

Commercial-readiness signals

Narrative/reputation landscape

Real Chemistry relevance

Source-permission notes

Human-review questions

Suggested next step

The dossier should show the reasoning chain: source → fact → signal → inflection hypothesis → Real Chemistry relevance → internal question.

Evaluation: prove usefulness without fake precision

Pilot 1 should be judged by whether it improves internal review, not by whether every ranked company becomes an account.

Research quality

citation accuracy, source coverage, stale-record rate, contradiction flags

Decision quality

reviewer usefulness, false positives, quality of reasons to advance/defer

Commercial relevance

accounts worth internal review, service-fit clarity, timing insight

Governance

source permissions, restricted-source exclusion, audit completeness

Learning

which signals predicted interest, deferral, pursuit or rejection

Baseline comparison

Compare the portfolio against a simple financing list, a simple clinical-stage list, and any Real Chemistry target list that can be safely used. The method must add judgment, not just decoration.

The exact ask to Will

The meeting should resolve whether Pilot 1 is worth running and what small set of inputs would make it more useful without pulling it into internal systems prematurely.

- Confirm the scope: emerging neuropsychiatry, geography and company stage.
- Identify the intended internal reader of the final portfolio.
- Name any Real Chemistry public service priorities Pilot 1 should map against.
- Confirm whether the full 50-75-company Pilot 1 can proceed externally without internal data.
- Identify what would make the final portfolio useful enough to consider calibration.
- Reserve ANATOMI, CRM and licensed-data questions for a later implementation decision unless Will wants them explored now.

Appendix A: Evidence-of-capability register

The register distinguishes what public primary sources establish from what only Real Chemistry can confirm internally.

CONFIRMED HAVE**ANATOMI**

AI ecosystem combining data, LLMs, orchestration, analytics and agenti
Is it used for internal growth?

CONFIRMED HAVE**Analytics & Insights**

broad AI/ML capabilities and named products
Which tools support prospect decisions?

CONFIRMED HAVE**HealthGEO**

AI-search perception/source intelligence
Can it assess non-client target companies?

CONFIRMED HAVE**ReputAI**

reputation measurement and predictive message testing
Can it feed account dossiers?

CONFIRMED/HISTORICAL**RCIS Workspace**

privacy-safe internal AI workspace and employee assistants
Current relationship to ANATOMI?

NOT PUBLICLY EVIDENCED**Prospect scoring**

no public source documents new-logo target scoring
Does a private system exist?

INTERNALLY UNKNOWN**CRM-enriched viability**

requires client/status/pursuit/conflict data
What system holds this?

Appendix B: Assumption register

Therapeutic scope

Assumption: Emerging neuropsychiatry and adjacent CNS/brain-health modalities / Disposition: Confirm with Will

Observable need

Assumption: Public signals can identify potential commercialization needs before RFPs / Disposition: Test in Pilot 1

Service mapping

Assumption: Signals can be mapped to Real Chemistry capabilities using public service language / Disposition: Calibrate later

Score weights

Assumption: Initial weights are decision aids, not validated predictions / Disposition: Sensitivity analysis

Internal viability

Assumption: Cannot be known from public sources / Disposition: Requires Real Chemistry context

Appendix C: Minimum data structure

1

company

legal name, display name, parent/subsidiary, stage, geography, therapeutic area

3

claim

source-linked proposition, status, reviewer, confidence, valid-from/until

5

score

factor, weight, score, rationale, sensitivity

2

source

type, URL, publication date, retrieval date, permission class, evidence tier

4

signal

category, signal type, date, evidence basis, hypothesis

6

dossier

summary, facts, inferences, unknowns, RC relevance, recommended action

Appendix D: Build-versus-buy logic

The market can provide many raw ingredients. The proprietary layer is the Real Chemistry-specific translation into growth decisions.

Buy or reuse

pipeline data, company data, financing data,
HCP/HCO data, media/social tools, dashboards,
model access, CRM infrastructure

Build

opportunity ontology, neuropsychiatry
taxonomy, external opportunity score, service
mapping, internal viability logic, review
process

Learn

pursuit outcomes, false positives, wins/losses,
practice feedback, signal-weight calibration

The moat is not a static list. It is accumulated decision history plus Real Chemistry-specific service logic and outcome learning.

Source ledger

Primary and official sources used for the public capability assessment. Dynamic webpages should be rechecked before external circulation.
